

inspHire Mobile Working

Advent Processing Solutions Ltd.

Freedom to Work Without Wires

You should be able to work when you want, where you want, which is why inspHire Mobile Working was created

At a Glance

What is it?

inspHire Mobile Working is a portable version of inspHire which allows you to carry out certain processes without the inconvenience of being in front of a hardwired workstation. Users can process rental contracts, sales orders and even workshop jobs on site, in a yard or warehouse environment. Using the latest .Net technology inspHire Mobile Working frees your staff to process orders more efficiently and with barcode or RFID functionality even quicker than ever.

Who's it for?

Where users need to be away from the workstation and cannot get access to the inspHire system, Mobile Working is essential to allow them to do their job. Gone are the problems of completing picking lists, stock takes, enquiries and dealing with off-hires away from the system.

1. Time is money

Allowing certain processes to be carried out immediately will save both time and money with less errors transferring hand-written information into the inspHire system. Reading barcodes or RFID tags as you are picking equipment and relaying this information back to the inspHire system is easy. Damage assessment at the point of return using the device will result in time and money savings when processing damage charges. Mobile fitters can be sent jobs whilst out on the road, they can complete the workshop job with parts used and any chargeable time without having to come back in to the office allowing an invoice to be raised immediately.

2. Usability

Designed with the end-user in mind, the screens are clear and simple to use with the operator only having to complete critical information. The views are displayed in such a way so as the users see only the information they need to see.

3. Total Mobility

Information can be sent back to the main system in 3 ways; devices with mobile phone technology can send and receive data and information over a GSM, GPRS or 3G data connection, a Local Wireless Network or local synchronisation via a docking station attached to the workstation.

inspHire Mobile Working

What inspHire Mobile Working can do for your business

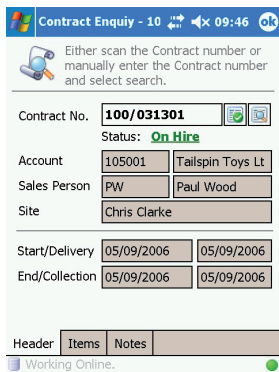

The time taken to despatch orders and gather critical charging information can be dramatically reduced leaving you more time to do what you do best: serving your customer base. The ability to remotely access critical information is vital in a busy organisation.

Introducing inspHire Mobile Working -

Rental and Sales

The person responsible for picking the items can make general enquiries directly from the device and stock can be allocated to the bookings either manually by typing in the item number or using the barcode or RFID reader. The user can also add new sale or rental items directly to the order.

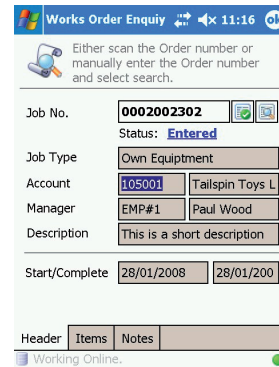

During off-hire, the user can read the barcode or RFID tags of the item being returned (or manually type it in) and the device will instantly know which contract to process. The item can then be marked as OK, Damaged or lost ready for final processing in the inspHire main system.

An audit trail is maintained against the order to log events that have taken place with the person responsible and the date and time of each operation.

Workshop

Workshop Jobs created on inspHire can be accessed on the mobile device, stock can be issued directly to the job as well as labour and any notes for that job. The job can be completed on the device and updated to the inspHire system at the touch of a button allowing invoicing to take place immediately. Fitters can now work out in the field with all the information they need.

Stock Take

Downloading the items to count to the device will store all the information required for the device to carry out a stock take, simply scan the barcode or RFID tag of the item you wish to count (or manually enter the item code) and enter the quantity counted against the item with a location if you wish. If the device has a live connection this can be updated immediately. Variance and other reports can be retrieved from the inspHire system to reconcile any differences.

Security

Each user will have their own individual username and password to log on, enabling them to gain access to information on the device.

The Next Step
